This specifications document describes the command specifications for the STAR Graphic Mode on line thermal printers.

Information contained herein applies to models with the following conditions.

- Line thermal printers
- Interface
 - USB
 - Ethernet
 - Wireless LAN
 - Bluetooth

<Name of applicable models>

- TSP100U
- TSP100PU
- TSP100GT
- TSP100LAN
- TSP100IU
- TSP100IIW
- TSP100IIILAN
- TSP100IIIBI
- TSP100IIIU

1. INTERFACE CONFIGURATION

1-1) USB Interface

Specifications: Conforms to USB2.0 Full Speed
 Supports Printer class and vendor class
 Connector: Type A (TSP100IIIU)
 Type B (TSP100U, TSP100PU, TSP100IIU, TSP100GT, TSP100IIIU)
 PoweredUSB (TSP100PU)

1-2) Ethernet Interface

Specifications: Physical layer, MAC layer: 10Base-T/100Base-TX (IEEE802.3/IEEE802.3u)
 Protocol: TCP/IP v4
 Connector: RJ45 (TSP100LAN)

1-3) Wireless LAN Interface

Specifications: Conforms to IEEE 802.11b/g/n

2. COMMAND FUNCTION LIST

• Standard Commands

Class	Command	Name	Line mode	Raster mode
External device drive	ESC BEL	Set pulse width for external device drive	○	○
	BEL	External device 1 drive instruction	○	○
	FS	External device 1 drive instruction	○	○
	SUB	External device 2 drive instruction	○	○
	EM	External device 2 drive instruction	○	○
	ESC GS BEL	Ring buzzer	○	○
	ESC GS EM DC1	Set external buzzer drive pulse condition	○	○
	ESC GS EM DC2	Output External buzzer drive pulse	○	○
Print settings	ESC RS A	Set print area	○	○
	ESC RS d	Set print density	○	○
	ESC RS r	Set printing speed	○	○
	ESC GS c	Set reduced printing	○	○
Status	ESC RS a	Set status transmission conditions	○	○
	ESC ACK SOH	Real-time printer status (ASB status)	○	○
	ETB	Update ETB status	○	○
	ESC RS E	Clear ETB counter, ETB status	○	○
	ESC GS ETX	Document start, Document end	○	○
Other	ESC GS #	Set memory switch	○	○
	ESC ?	Reset printer	○	○
	ESC GS L DC1	Set LED blink condition	○	○
	ESC GS L DC2	LED blink	○	○

• Raster related commands

Class	Command	Name	Line mode	Raster mode
Raster	ESC * r R	Initialize raster mode	○	○
	ESC * r A	Enter raster mode	○	○
	ESC * r B	Quit raster mode	×	○
	ESC * r C	Clear raster data	×	○
	ESC * r D	Drive drawer	×	○
	ESC * r E	Set EOT mode	×	○
	ESC * r F	Set FF mode	×	○
	ESC * r P	Set page length	×	○
	ESC * r Q	Set print quality	×	○
	ESC * r m l	Set left margin	×	○
	ESC * r m r	Set right margin	×	○
	ESC * r t	Set top margin	×	○
	ESC * r K	Set print color	×	○
	b n1 n2 d1. . . dk	Transfer raster data (auto line feed)	×	○
	k n1 n2 d1. . . dk	Transfer raster data	×	○
	ESC * r Y	Position movement in vertical direction	×	○
	ESC FF NUL	Execute FF mode	×	○
	ESC FF EOT	Execute EOT mode	×	○
	ESC * r V	Execute external buzzer drive	×	○

• USB-I/F related commands

Class	Command	Name	Line mode	Raster mode
USB-I/F	ESC # # W	Register/Initialize USB serial number	○	○

• Print mode related commands

Class	Command	Name	Line mode	Raster mode
Select print mode	ESC RS C	Select print mode	○	○
	ESC RS S	Select print startup setting	○	○

• Printer information related commands

Class	Command	Name	Line mode	Raster mode
Register printer information	ESC GS (S	Register/Clear printer information	○	○
Send printer information	ESC GS) I	Send printer information	○	○

• Customer Display commands

Class	Command	Name	Line mode	Raster mode
Select print mode	ESC GS B @	Send data to a customer display	○	○
	ESC RS B A	Status request	○	○
	ESC GS B B	Customer display data request	○	○
	ESC GS B C	Buffer clear	○	○

3. COMMAND DETAILS

3-1) Standard Command Details

3-1-1) External Device Drive

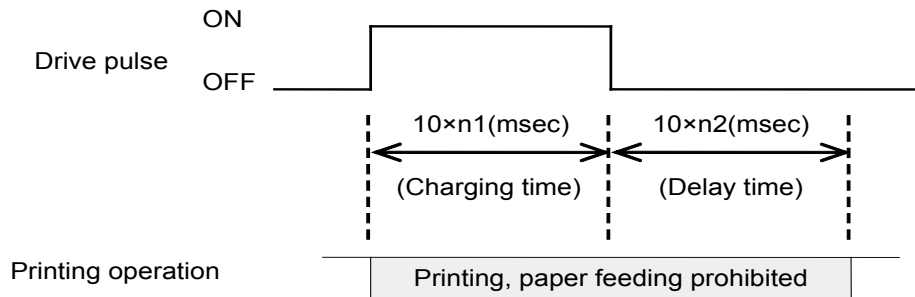

ESC BEL n1 n2

[Name]	Set external drive device 1 pulse width				
[Code]	ASCII	ESC BEL	n1	n2	
	Hex	1B 07	n1	n2	
	Decimal	27 7	n1	n2	

[Defined Area] $1 \leq n1 \leq 127$
 $1 \leq n2 \leq 127$

[Initial Value] n1 = 20 (Energizing time: 200 msec)
 n2 = 20 (Delay time: 200 msec)

[Function] Sets the energizing and delay times for driving the external device.
 • Energizing time = 10 x n1 (ms)
 • Delay time = 10 x n2 (ms)
 This setting value is not initialized with a soft reset.

BEL

[Name] External device 1 drive instruction
 [Code] ASCII BEL
 Hex 07
 Decimal 7

[Defined Area] ---

[Initial Value] ---

[Function] Executes the external device drive conditions set according to the command to set the external drive device pulse width (ESC BEL n1 n2).
 External device 1 and external device 2 cannot be executed simultaneously.
 If unprinted data exists, the unprinted data is printed out and then the command is executed.

FS

[Name] External device 1 drive instruction
 [Code] ASCII FS
 Hex 1C
 Decimal 28

[Defined Area] ---

[Initial Value] ---

[Function] Executes the external device drive conditions set according to the command to set the external drive device pulse width (ESC BEL n1 n2).
 External device 1 and external device 2 cannot be executed simultaneously.
 If unprinted data exists, the unprinted data is printed out and then the command is executed.

SUB

[Name] External device 2 drive instruction
 [Code] ASCII SUB
 Hex 1A
 Decimal 26

[Defined Area] ---

[Initial Value] ---

[Function] Drives external device 2.
 The energizing time and delay time for external device 2 are fixed at 200 ms each.
 External device 1 and external device 2 cannot be executed simultaneously.
 If unprinted data exists, the unprinted data is printed out and then the command is executed.

EM

[Name] External device 2 drive instruction
 [Code] ASCII EM
 Hex 19
 Decimal 25

[Defined Area] ---

[Initial Value] ---

[Function] Drives external device 2.
 The energizing time and delay time for external device 2 are fixed at 200 ms each.
 External device 1 and external device 2 cannot be executed simultaneously.
 If unprinted data exists, the unprinted data is printed out and then the command is executed.

ESC GS BEL m n1 n2

[Name]	Ring buzzer						
[Code]	ASCII	ESC	GS	BEL	m	n1	n2
	Hex	1B	1D	07	m	n1	n2
	Decimal	27	29	7	m	n1	n2

[Defined Area] $1 \leq m \leq 2$
 $1 \leq n1 \leq 255$
 $1 \leq n2 \leq 255$

[Initial Value] ---

[Function] Rings the buzzer.

m specifies the drive terminal of the buzzer.

m	Buzzer Drive Terminal
1, 49	Buzzer Drive Terminal 1
2, 50	Buzzer Drive Terminal 2

n1 specifies energizing time; n2 specifies the delay time.

- Energizing time = $20 \times n1$ (ms)
- Delay time = $20 \times n2$ (ms)

The buzzer will not ring while printing.

Use of this command other than for ringing the buzzer is prohibited.

(There is the possibility of damage if using this command for driving the drawer on models that support external device terminals.)

ESC GS EM DC1 m n1 n2

[Name]	Set external buzzer drive pulse condition							
[Code]	ASCII	ESC	GS	EM	DC1	m	n1	n2
	Hex	1B	1D	19	11	m	n1	n2
	Decimal	27	29	25	17	m	n1	n2

[Defined Area] $1 \leq m \leq 2, 49 \leq m \leq 50$
 $0 \leq n1 \leq 255$
 $0 \leq n2 \leq 255$

[Initial Value] $n1 = 0, n2 = 0$

[Function] Set external buzzer drive pulse condition
 m specifies the buzzer drive terminal to perform the condition settings.

m	Buzzer Drive Terminal
1, 49	Buzzer Drive Terminal 1
2, 50	Buzzer Drive Terminal 2

n1 specifies energizing time; n2 specifies the delay time.

- Energizing time = $20 \times n1$ (ms)
- Delay time = $20 \times n2$ (ms)

Drives for external buzzers set using this command is performed by <ESC> <GS> <DC2> m n1 n2.
 When $n1 = 0$, regardless of the value of $n2$, the external buzzer drive command <ESC><GS><DC2> is ignored.

This setting value is not initialized with a soft reset.

ESC GS EM DC2 m n1 n2

[Name]	Output External buzzer drive pulse							
[Code]	ASCII	ESC	GS	EM	DC2	m	n1	n2
	Hex	1B	1D	19	12	m	n1	n2
	Decimal	27	29	25	18	m	n1	n2

[Defined Area] $1 \leq m \leq 2, 49 \leq m \leq 50$
 $1 \leq n1 \leq 20$
 $n2 = 0$

[Initial Value] ---

[Function] Repeatedly drives the buzzer according to the ON/OFF conditions set by the external buzzer drivepulse conditions command <ESC> <GS> <DC1> m t1 t2.
 m specifies the buzzer drive terminal to drive.

m	Buzzer Drive Terminal
1, 49	Buzzer Drive Terminal 1
2, 50	Buzzer Drive Terminal 2

Specifies the number of repetitions of the buzzer drive with $(n2 \times 256 + n1)$.

The buzzer will not ring while printing.

Use of this command other than for ringing the buzzer is prohibited.

(If this command is used to drive the cash drawer on models that have an external device terminal, the system will be damaged. Absolutely never use it for other purposes.)

The buzzer can be stopped by pressing the paper feed switch when it is ringing.

<Example>

(Special Note) If off time=0, it is only possible to continuously sound it n1 times.
 For example, if on=5 seconds, off=0 and n1=20 times, it will sound for 100 seconds.

3-1-2) Print Settings

ESC RS A n

[Name]	Set print area				
[Code]	ASCII	ESC	RS	A	n
	Hex	1B	1E	41	n
	Decimal	27	30	65	n

[Defined Area] $0 \leq n \leq 1$

[Initial Value] Memory SW setting

[Function] Sets the print area according to n.

Set n to be the same as the print area setting of MSW. (See MSW setting of each model for details)

If unprinted data exists when processing this command, the data is printed out and then the command is executed.

(Cutting and feeding operations are not performed.)

This command is executed after the print operation is stopped.

The raster left and right margin settings are initialized.

This setting value is initialized with a soft reset.

ESC RS d n

[Name]	Set print density				
[Code]	ASCII	ESC	RS	d	n
	Hex	1B	1E	64	n
	Decimal	27	30	100	n

[Defined Area] $0 \leq n \leq 6$
 $48 \leq n \leq 57$ ("0" $\leq n \leq$ "6")

[Initial Value] Memory SW setting

[Function] Sets print density.

If unprinted data exists when processing this command, the data is printed out and then the command is executed.

This command is executed after the print operation is stopped.

When in two-color printing mode, only print density for red printing can be set by this command.

n	Print Density			
	Single Color Printing Mode	Two-Color Printing Mode Red Print Density Double Resolution Mode	Energy saving mode 1	Energy saving mode 2
0, 48	Print density +3	Red print density +	Print density +3	Print density +3
1, 49	Print density +2	Red print density +	Print density +2	Print density +2
2, 50	Print density +1	Red print density (Standard)	Print density +1	Print density +1
3, 51	Print density (Standard)	Red print density (Standard)	Print density (Standard)	Print density (Standard)
4, 52	Print density -1	Red print density (Standard)	Print density -1	Print density -1
5, 53	Print density -2	Red print density -	Print density -2	Print density -2
6, 54	Print density -3	Red print density -	Print density -3	Print density -3

ESC RS r n

[Name]	Set print speed				
[Code]	ASCII	ESC	RS	r	n
	Hex	1B	1E	72	n
	Decimal	27	30	114	n

[Defined Area] $0 \leq n \leq 2$
 $48 \leq n \leq 50$ ("0" $\leq n \leq$ "2")

[Initial Value] Memory SW setting

[Function] Sets print speed.

If unprinted data exists when processing this command, the data is printed out and then the command is executed.

This command is executed after the print operation is stopped.

Since the printing speed in two-color printing mode, energy saving mode 1 are fixed, the speed settings with this command are invalid. However, the settings of this command become valid when returning from two-color printing mode, energy saving mode 1 to single color printing mode.

n	Print Speed			
	Single Color Printing Mode	Two-color Printing Mode	Energy saving mode 1	Energy saving mode 2
0, 48	High speed	Invalid	Invalid	Invalid
1, 49	Mid-speed	Invalid	Invalid	Invalid
2, 50	Slow speed	Invalid	Invalid	Invalid

ESC GS c h v

[Name] Set reduced printing
 [Code] ASCII ESC GS c h v
 Hex 1B 1D 63 h v
 Decimal 27 29 99 h v

[Defined Area] $0 \leq h \leq 255$

$0 \leq v \leq 255$

[Initial Value] $h = 0$ (Always 0)

$v = 0$ (When not set) or previously set value

[Function] Sets reduced printing.

If unprinted data exists, the unprinted data is printed out and then the command is executed.

h	Set horizontal direction of reduced printing	Remarks
0	Always 0	

v	Set vertical direction of reduced printing	Remarks
0	Invalid (100%)	Setting is stored to non-volatile memory
1	Valid (50%)	Setting is stored to non-volatile memory
2	Valid (75%)	Setting is stored to non-volatile memory

- The reduced printing setting can be changed or disabled for a receipt. However, intermittent printing will occur when it is switched (Print quality is no guaranteed).
- If the correct setting value is specified, it is stored to non-volatile memory.
- The print quality is not guaranteed for reduced printing (barcodes and 2D barcodes may not be read correctly at times).

3-1-3) Status

ESC RS a n

[Name] Set status transmission conditions

[Code] ASCII ESC RS a n
 Hex. 1B 1E 61 n
 Decimal 27 30 97 n

[Defined Area] $0 \leq n \leq 3$, $48 \leq n \leq 51$ ("0" $\leq n \leq$ "3")
 n=16, n=255

[Initial Value] Set by memory switches.

[Function] Sets the status transmission conditions.
 See Appendix 1 for details regarding ASB status.
 See each printer's product specifications manual for details on the memory switch settings.

n	Status transmission conditions
0, 48	ASB Invalid , NSB Invalid
1, 49	ASB Valid , NSB Invalid
2, 50	ASB Invalid , NSB Valid
3, 51	ASB Valid , NSB Valid
16	Returns the ASB and NSB settings to the initial state previously set by the MSW.
255	Sends the ASB status information.

ESC ACK SOH

[Name] Real-time printer status (ASB status)

[Code] ASCII ESC ACK SOH
 Hex. 1B 06 01
 Decimal 27 6 1

[Defined Area] - - -

[Initial Value] - - -

[Function] Sends ASB status information to the host.
 This command is not used when ASB is valid.
 See Appendix 1, Automatic Status for details regarding ASB status.

ETB

[Name] Update ETB status of normal status

[Code] ASCII ETB
 Hex 17
 Decimal 23

[Defined Area] ---

[Initial Value] ---

[Function] Sets the ETB status of the normal status and updates the ETB counter.
 If unprinted data exists when processing this command, the data is printed out and then the command is executed.
 (Cutting and feeding operations are not performed.)
 This command is executed after the print operation is stopped.
 For information on the normal status, see Appendix-1.

ESC RS E n

[Name] Initialize normal status ETB counter and ETB status

[Code]	ASCII	ESC	RS	E	n
	Hex	1B	1E	45	n
	Decimal	27	30	69	n

[Defined Area] n = 0

n = 48 ("0")

[Initial Value] Normal status ETB counter = 0

[Function] Clears the normal status ETB counter to zero and ETB status.

ESC GS ETX s n1 n2

[Name] Document start , end
 [Code] ASCII ESC GS ETX s n1 n2
 Hexadecimal 1B 1D 03 s n1 n2
 Decimal 27 30 3 s n1 n2

[Defined Area] $3 \leq s \leq 5$

[Function] This command is run when reading from the reception buffer. Processes the print end counter according to the s parameter.

s	Name	Function
3	Start document n1, n2 = 0	(1) Sets data intake mode (2) Initialize
4	End document n1, n2 = 0	(1) Prints data in line buffer, if data exists. (2) Waits until printing ends (motor stops). (3) Cancels data intake mode
5	Data timeout setting	n1=0 : Initializes to the content of MSW. (n2=0) n1=1 : Data timeout setting n2=0 : Timeout disabled Others: n2 = Data timeout time (units: seconds 1 to 255 seconds) n1=2: Sends the current timeout setting to the host. (n2=0)

When s = 3, and s = 4 (Document start command + document end command), printer operates as though in data cancel mode.

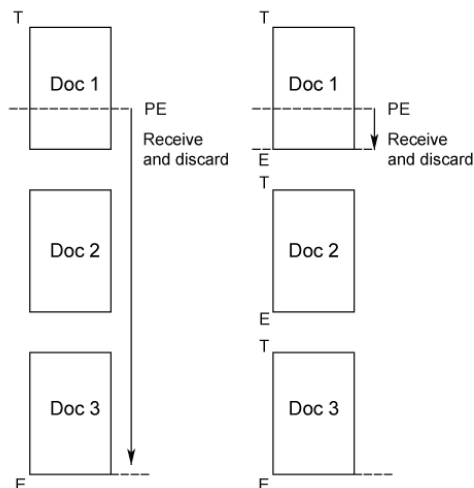

If there is an error after receiving the document start command, reception data is received and discarded until the document end command is received when the printer is recovered from the error. If the document end command cannot be recognized, all reception data is destroyed. Timeouts are 10 seconds. Automatically cancels the data intake mode.

Restrictions

- 1) Sleep mode decrease
- 2) Erroneous printing occurs if the same data as the End command is contained in the raster data.
- 3) If the interval of data transmission is longer than the timeout time for some reason, it will be judged as an error even though the transmission is not actually disconnected. In case of data cancellation, data up to the document end command will be cancelled. Be sure to check by ETB to control.

When s = 3, initialize the following settings using the initializing process.

<T:TOP Command/E:END Command>

The interface disconnection detection function through data reception timeout is controlled when s=5 is specified.

When this function is enabled, the interface is determined to have been disconnected when no data is received for a specified period of time at the data read section of the printer.

When a disconnection is detected during a command execution, the command parsing is stopped.

When data cancel is enabled, the print start function using the timer (ESC GS g 1) is disabled, and data is canceled.

n1=0 and n2=0: Initializes the interface disconnection detection function through data reception timeout. (Returns to the MSW settings. The initial value for the timeout time is 3 seconds.)

n1=1 : Set enable/disable and the timeout time for data reception timeouts.

When n2 is 0, the disconnection detection function is disabled due to data reception timeouts.

When n2 is anything except for 0, the data reception timeout is set. (Units: seconds, 1 to 255 seconds)

n1=2 and n2=0: Sends the current setting to the host.

The data format returned to the host is as shown below.

<Returned Data Formats>

Code ASCII ESC GS ETX s n1 n2 [timeout setting] NUL

Hex. 1B 1D 03 s n1 n2 [timeout setting] 00

Decimal 27 29 3 s n1 n2 [timeout setting] 0

* Echoes back the specified contents from the host as is until ESC GS ETX s n1 n2, and then sends the print end counter value and NUL.

This function is invalid at the time of program rewriting.

3-1-4) Other

ESC GS # m N n1 n2 n3 n4 LF NUL

[Name]	Set memory SW											
[Code]	ASCII	ESC	GS	#	m	N	n1	n2	n3	n4	LF	NUL
	Hex	1B	1D	23	m	N	n1	n2	n3	n4	0A	00
	Decimal	27	29	35	m	N	n1	n2	n3	n4	10	0

[Defined Area] m = 87, 84, 44, 43, 45, 64 (m = "W", "T", ",", "+", "-", "@")
 $48 \leq N \leq 57$ ("0" \leq N \leq "9"), $65 \leq N \leq 70$ ("A" \leq N \leq "F"), $97 \leq N \leq 102$ ("a" \leq N \leq "f")
 $48 \leq n1 \leq 57$ ("0" \leq n1 \leq "9"), $65 \leq n1 \leq 70$ ("A" \leq n1 \leq "F"), $97 \leq n1 \leq 102$ ("a" \leq n1 \leq "f")
 $48 \leq n2 \leq 57$ ("0" \leq n2 \leq "9"), $65 \leq n2 \leq 70$ ("A" \leq n2 \leq "F"), $97 \leq n2 \leq 102$ ("a" \leq n2 \leq "f")
 $48 \leq n3 \leq 57$ ("0" \leq n3 \leq "9"), $65 \leq n3 \leq 70$ ("A" \leq n3 \leq "F"), $97 \leq n3 \leq 102$ ("a" \leq n3 \leq "f")
 $48 \leq n4 \leq 57$ ("0" \leq n4 \leq "9"), $65 \leq n4 \leq 70$ ("A" \leq n4 \leq "F"), $97 \leq n4 \leq 102$ ("a" \leq n4 \leq "f")

[Initial Value] ---

[Function] Sends command to write after defining memory switch using the definition command specified by the following classes.

Memory switch information defined by the command to write is written to the volatile memory.

When writing to the volatile memory by the command to write, the printer executes a reset.

For information on the memory switch, see the product specifications document for each model.

Function	Class	m	N	n1 n2 n3 n4
Definition data write and reset	Write	"W"	Fixed at "0"	Fixed at "0000"
Definition data write and reset and self print	Write	"T"	Fixed at "0"	Fixed at "0000"
Data definition (data specification)	Definition	","	N	n1 n2 n3 n4
Data definition (specify bit and set)	Definition	"+"	N	n1 n2 n3 n4
Data definition (specify bit and clear)	Definition	"-"	N	n1 n2 n3 n4
Definition data (all data initialized)	Definition	"@"	Fixed at "0"	Fixed at "0000"
Data definition (load factory setting)	Definition	"*"	Fixed at "0"	Fixed at "0000"

- m : Mode selection
- N : Memory switch number to specify
- n1 n2 n3 n4 : Specified data
 - m="," -> Specified data
 - m="+" -> Bit number to set
 - m="-" -> Bit number cleared

ESC ? LF NUL

[Name]	Reset printer (execute self print)				
[Code]	ASCII	ESC	?	LF	NUL
	Hex	1B	3F	0A	00
	Decimal	27	63	10	0

[Defined Area] ---
 [Initial Value] ---
 [Function] After executing a software reset, executes self print once.

ESC GS L DC1 m n1 n2

[Name]	Set LED blink condition							
[Code]	ASCII	ESC	GS	L	DC1	m	n1	n2
	Hex	1B	1D	4C	11	m	n1	n2
	Decimal	27	29	76	17	m	n1	n2

[Defined Area] $1 \leq m \leq 2, 49 \leq m \leq 50$
 $0 \leq n1 \leq 255$
 $0 \leq n2 \leq 255$

[Initial Value] $n1 = 0, n2 = 0$

[Function] Sets LED flashing conditions.

m specifies the LED applicable to the condition settings.

m	LED
1, 49	ERROR LED (Red)
2, 50	READY LED (Blue)

n1 specifies lit time; n2 specifies the time the LED turns off.

- Lit time = $20 \times n1$ (ms)
- Turn off time = $20 \times n2$ (ms)

Perform LED flashing set with this command using <ESC><GS>"L"<DC2> m n1 n2.

When $n1 = 0$, regardless of the value of $n2$, the LED flash command <ESC><GS>"L"<DC2> is ignored.

This setting value is not initialized with a soft reset.

ESC GS L DC2 m n1 n2

[Name]	LED blink							
[Code]	ASCII	ESC	GS	L	DC2	m	n1	n2
	Hex	1B	1D	4C	12	m	n1	n2
	Decimal	27	29	76	18	m	n1	n2

[Defined Area] $1 \leq m \leq 3, 49 \leq m \leq 51$
 $1 \leq n1 \leq 20$
 $n2 = 0$

[Initial Value] ---

[Function] Repeatedly flashes the LED according to the ON/OFF conditions set by the LED flashing condition setting command <ESC><GS>"L"<DC1> m t1 t2.

m specifies the LED to flash.

m	LED
1, 49	ERROR LED (Red)
2, 50	READY LED (Blue)
3, 51	ERROR LED (Red), READY LED (Blue)

Specifies the number of repetitions of the LED flash with $(n2 \times 256 + n1)$.

After the command is executed, the LED display pattern occurs after according to the status of the printer.

<Example>

(Special note) If off time=0, it can be set to continuously lit only for n1 number of times
 For example, if on=5 seconds, off=0 and n1=20 times, it will be lit for 100 seconds.

3-2) Raster Graphics Command Details

During line mode, these commands are prohibited from being used because they will not be processed be correctly. (Excluding ESC * r R command, ESC * r A command and ESC * r a command.)

ESC * r R

[Name]	Initialize raster mode				
[Code]	ASCII	ESC	*	r	R
	Hex	1B	2A	72	52
	Decimal	27	42	114	82

[Defined Area] ---

[Initial Value] ---

[Function] Executes the initialization of raster mode.

This command is valid for other modes besides raster mode.

The raster mode initialization performed by this command is executed when entering raster mode.

This command initializes the following setting contents.

- Raster page length setting (ESC * r P n NUL)
- Raster print color setting (ESC * r K n NUL)
- Raster top margin setting (ESC * r T n NUL)
- Raster left margin setting (ESC * r T n NUL)
- Raster right margin setting (ESC * r T n NUL)
- Raster EOT mode setting (ESC FF EOT)
- Raster FF mode setting (ESC FF NUL)
- Clear raster image buffer

When entering raster mode, the command executes a process identical to initializing raster mode.

As the following setting is not initialized when entering raster mode, send this initialization command when initializing the contents below,

- Raster data print color setting (ESC * r K n NUL)
- (*) Raster print quality setting (ESC * Q n NUL)

ESC * r A

[Name]	Enter raster mode				
[Code]	ASCII	ESC	*	r	A
	Hex	1B	2A	72	41
	Decimal	27	42	114	65

[Defined Area] ---

[Initial Value] ---

[Function] Enters raster mode.

This command is ignored during raster mode.

When entering raster mode, raster mode is initialized.

The corresponding initialization contents are listed below.

- Raster page length setting (ESC * r P n NUL)
- Raster top margin setting (ESC * r T n NUL)
- Raster left margin setting (ESC * r T n NUL)
- Raster right margin setting (ESC * r T n NUL)
- Raster EOT mode setting (ESC FF EOT)
- Raster FF mode setting (ESC FF NUL)

(*) Raster print color setting(ESC * r K n NUL)is not initialized when entering raster mode.

(*) Raster print quality setting (ESC * Q n NUL)is not initialized when entering raster mode.

If the printer is in command emulator mode and there is unprinted data, this command is processed after the unprinted data is printed. (Cutting and feeding operations are not performed.)

ESC * r B

[Name]	Quit raster mode				
[Code]	ASCII	ESC	*	r	B
	Hex	1B	2A	72	42
	Decimal	27	42	114	66

[Defined Area] ---

[Initial Value] ---

[Function] Ends raster mode.

When raster mode ends, and if raster data still remains in the image buffer of the raster mode, after executing raster EOT mode, terminate the raster mode.

ESC * r C

[Name]	Clear raster data				
[Code]	ASCII	ESC	*	r	C
	Hex	1B	2A	72	43
	Decimal	27	42	114	67

[Defined Area] ---

[Initial Value] ---

[Function] Clears the image buffer data of raster mode.

ESC * r D n NUL

[Name]	Drive drawer						
[Code]	ASCII	ESC	*	r	D	n	NUL
	Hex	1B	2A	72	44	n	00
	Decimal	27	42	114	68	n	0

[Defined Area] $0 \leq n \leq 3$

[Initial Value] $n = 0$

[Function] Executes the drawer drive during raster mode.

Drawer driving conditions is equivalent to the conditions set by the line mode.

$n1$ is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

n	Drive circuit
0	None
1	Drive external device drive 1
2	Drive external device drive 2
3	Drive external device drive 1 + Drive external device drive 2

ESC * r E n NUL

[Name]	Set raster EOT mode						
[Code]	ASCII	ESC	*	r	E	n	NUL
	Hex	1B	2A	72	45	n	00
	Decimal	27	42	114	69	n	0

[Defined Area] $n = 0, 1, 2, 3, 8, 9, 12, 13, 32, 33, 36, 37$

[Initial Value] Cutter model $n = 13$

TearBar model $n = 3$

[Function] Sets the raster EOT mode.

The EOT mode is an operation to be performed by the raster document end command (ESC FF EOT).

$n1$ is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

<EOT mode setting format>

n	Model		Function		
	Cutter	TearBar	FormFeed	Cut Feed	Cutter
0	Valid	Valid	Set To Default	Set To Default	Set To Default
1	Valid	Valid	o	--	--
2	Valid	Invalid	o	o	--
3	Invalid	Valid	o	TearBar	--
8	Valid	Invalid	o	--	Full Cut
9	Valid	Invalid	o	o	Full Cut
12	Valid	Invalid	o	--	Partial Cut
13	Valid	Invalid	o	o	Partial Cut
32	Invalid	Invalid			
33	Invalid	Invalid			
36	Invalid	Invalid			
37	Invalid	Invalid			

ESC * r F n NUL

[Name] Set raster FF mode
 [Code] ASCII ESC * r F n NUL
 Hex 1B 2A 72 46 n 00
 Decimal 27 42 114 70 n 0

[Defined Area] n = 0, 1, 2, 3, 8, 9, 12, 13, 32, 33, 36, 37

[Initial Value] Cutter model n = 13

TearBar model n = 3

[Function] Sets the raster FF mode.

The FF mode is an operation to be performed by the raster document end command (ESC FF NUL).
 n1 is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

<FF mode setting format>

n	Model		Function		
	Cutter	TearBar	FormFeed	Cut Feed	Cutter
0	Valid	Valid	Set To Default	Set To Default	Set To Default
1	Valid	Valid	o	--	--
2	Valid	Invalid	o	o	--
3	Invalid	Valid	o	TearBar	--
8	Valid	Invalid	o	--	Full Cut
9	Valid	Invalid	o	o	Full Cut
12	Valid	Invalid	o	--	Partial Cut
13	Valid	Invalid	o	o	Partial Cut
32	Invalid	Invalid			
33	Invalid	Invalid			
36	Invalid	Invalid			
37	Invalid	Invalid			

ESC * r P n NUL

[Name] Set raster page length
 [Code] ASCII ESC * r P n NUL
 Hex 1B 2A 72 50 n 00
 Decimal 27 42 114 80 n 0

[Defined Area] $0, 200 \leq n \leq 64000$ (Other than TSP100IIU) $0, 200 \leq n \leq 32000$ (TSP100IIU)

[Initial Value] ---

[Function] Sets the raster page length.

n1 is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

TSP100U, TSP100PU, TSP100GT, TSP100LAN, TSP100IIIW, TSP100IIILAN, TSP100IIIBI,
 TSP100IIIU

n	
0	Continuous printing mode (page length without setting, but maximum page length is 64000 dot)
$200 \leq n \leq 64000$	Specified page length

TSP100IIU

n	
0	Continuous printing mode (page length without setting, but maximum page length is 32000 dot)
$200 \leq n \leq 32000$	Specified page length

ESC * r Q n NUL

[Name] Set raster print quality
 [Code] ASCII ESC * r Q n NUL
 Hex 1B 2A 72 51 n 00
 Decimal 27 42 114 81 n 0

[Defined Area] $0 \leq n \leq 2$

[Initial Value] n = 0

[Function] Sets the raster print quality.

n1 is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

n	Print quality
0	High-speed printing specified
1	Normal print quality
2	High print quality

ESC * r m l n NUL

[Name]	Set the left margin of raster							
[Code]	ASCII	ESC	*	r	m	l	n	NUL
	Hex	1B	2A	72	6D	6C	n	00
	Decimal	27	42	114	109	108	n	0

[Defined Area] Print width: 72 mm mode $0 \leq n \leq 71$

Print width 51 mm mode $0 \leq n \leq 50$

[Initial Value] n = 0

[Function] Sets the left margin of the raster.

By this command set the left margin to (nx 8) dots.

If the left margin exceeds the printable area, or if there is no print area by the left margin specified ((printable area - right margin) \geq left margin specified value), it ignores this command.

nl is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

ESC * r m r n NUL

[Name]	Set the right margin of raster							
[Code]	ASCII	ESC	*	r	m	r	n	NUL
	Hex	1B	2A	72	6D	72	n	00
	Decimal	27	42	114	109	114	n	0

[Defined Area] Print width: 72 mm mode $0 \leq n \leq 71$

Print width 51 mm mode $0 \leq n \leq 50$

[Initial Value] n = 0

[Function] Sets the right margin of the raster.

By this command set the right margin to (nx 8) dots.

If the right margin exceeds the printable area,

or if there is no print area by the right margin specified ((printable area - left margin) \geq right margin specified value),

this command is ignored.

nl is a decimal notation using ASCII characters (up to 255 digits)

If raster data exists in the image buffer of raster mode, this command is ignored.

ESC * r t n NUL

[Name] Set the top margin of raster
 [Code] ASCII ESC * r t n NUL
 Hex 1B 2A 72 74 n 00
 Decimal 27 42 114 116 n 0

[Defined Area] $0 \leq n \leq 11$

[Initial Value] $n = 0$

[Function] Sets the top margin of the raster.
 n1 is a decimal notation using ASCII characters (up to 255 digits)

n	Top margin	Remarks
0	Set To Default	Default top margin differs with the model
Other than 0	When n value is for that model, enabled setting: set top margin disabled setting: ignore command	Enabled setting differs with the model

(*) Support of this command varies according to the model.

TSP100IU

n	Top margin	Remarks
0	Set To Default (3mm)	Setting is stored to non-volatile memory
3 to 11	Set top margin (3~11mm)	Setting is stored to non-volatile memory
Other than the above	Ignore command	

(*) When the top margin setting is 3 ~ 10mm, back feed is performed before printing starts.

Back feed operation by the top margin setting is performed only with the following timing.

- After the cutting operation (including error recovery operation)

ESC * r K n NUL

[Name]	Set raster print color						
[Code]	ASCII	ESC	*	r	K	n	NUL
	Hex	1B	2A	72	4B	n	00
	Decimal	27	42	114	75	n	0

[Defined Area] $0 \leq n \leq 3$

[Initial Value] $n = 0$

[Function] Sets the raster print color.

This command is valid only if it is designated a two-color printing mode by the line mode.

If not the two-color printing mode, ignore the command.

n1 is a decimal notation using ASCII characters (up to 255 digits)

n	Print color
0	Black
1	Cyan
2	Magenta
3	Yellow

(*) This command is valid only for two-color printing compatible models. Non-compatible models command ignored

b n1 n2 data

[Name]	Transfer of raster data (automatic line feed)							
[Code]	ASCII	b	n1	n2	d1	d2	...	dk
	Hex	62	n1	n2	d1	d2	...	dk
	Decimal	98	n1	n2	d1	d2	...	dk

[Defined Area] $0 \leq n1 \leq 255$
 $0 \leq n2 \leq 255$
 $0 \leq d \leq 255$
 $k = n1 + n2 \times 256$
 $1 \leq k$

[Initial Value] ---

[Function] Transfers the raster data.

Raster data is send at $(n1 + n2 \times 256)$ bytes binary data.

Raster data beyond the print area that is currently set is cut off.

The deployed position of the image buffer, after deploying the data to one dot column image buffer by this command, will one dot column automatic line feed, and move to the left margin of the next line position.

If it goes over page due to automatic line feed

- Page length settings are in continuous print mode, if it exceeds the maximum page length (see ESC * r P n NUL command)
- Page length set in the specified page length mode, and if it exceeds the specified page length, and print the data up to the end page, to process as the first line of data for the next page.

In addition, data expansion is performed by overwriting processing (OR processing) the current image buffer data.

For the set raster print color, the deployment image buffer is described below.

Print color	Deployment image buffer
Black	Black image buffer
Cyan	Colored image buffer
Magenta	Colored image buffer
Yellow	Colored image buffer

k n1 n2 data

[Name] Transfer raster data

[Code] ASCII k n1 n2 d1 d2 ... dk
 Hex 6B n1 n2 d1 d2 ... dk
 Decimal 107 n1 n2 d1 d2 ... dk

[Defined Area] $0 \leq n1 \leq 255$
 $0 \leq n2 \leq 255$
 $0 \leq d \leq 255$
 $k = n1 + n2 \times 256$
 $1 \leq k$

[Initial Value] ---

[Function] Transfers the raster data.
 Raster data is send at $(n1 + n2 \times 256)$ bytes binary data.
 Raster data beyond the print area that is currently set is cut off.
 The deployed position of the image buffer, after deploying the data to one dot column image buffer by this command, will not automatically line feed, and move to the left margin of the current line position.
 In addition, data expansion is performed by overwriting processing (OR processing) the current image buffer data.
 For the set raster print color, the deployment image buffer is described below.

Print color	Deployment image buffer
Black	Black image buffer
Cyan	Colored image buffer
Magenta	Colored image buffer
Yellow	Colored image buffer

ESC * r Y n NUL

[Name]	Moving position in the vertical direction (line break of a specified dot)						
[Code]	ASCII	ESC	*	r	Y	n	NUL
	Hex	1B	2A	72	59	n	00
	Decimal	27	42	114	89	n	0

[Defined Area] ---

[Initial Value] ---

[Function] Performs position movement of the raster vertical direction.
 With this command it will move the position of n dot.
 If the specified movement makes you go over the page

- If the page length settings are in continuous print mode, and the n dot is the maximum page length (see ESC * r P n NUL command)
- Page length set at the specified page length mode, and the n dot exceeds the specified page length to do this, you print the data up to the end page, and the section that is overflow will be treated as data from the beginning of the next page.

nI is a decimal notation using ASCII characters (up to 255 digits)

ESC FF NUL

[Name]	Execute FF mode			
[Code]	ASCII	ESC	FF	NUL
	Hex	1B	0C	00
	Decimal	27	12	0

[Defined Area] ---

[Initial Value] ---

[Function] Executes FF mode.
 It runs the operation specified in FF mode setting command (ESC * r F n NUL).
 If raster data exists in the image buffer for raster mode, FF mode is implemented after printing.
 If raster data does not exist in the image buffer for raster mode, this command is ignored.
 (TSP100IU) if the print paper length to be cut is less than 24mm, then empty feed is automatically added before cutting so that the printing paper length is 24mm.

ESC FF EOT

[Name]	Execute EOT mode			
[Code]	ASCII	ESC	FF	EOT
	Hex	1B	0C	04
	Decimal	27	12	4

[Defined Area] ---

[Initial Value] ---

[Function] Executes EOT mode.
 It runs the operation specified in EOT mode setting command (ESC * r E n NUL).
 If raster data exists in the image buffer for raster mode, EOT mode is implemented after printing.
 If raster data does not exist in the image buffer for raster mode, this command is ignored.
 (TSP100IU) if the print paper length to be cut is less than 24mm, then empty feed is automatically added before cutting so that the printing paper length is 24mm.

ESC * r a

[Name]	Start block				
[Code]	ASCII	ESC	*	r	a
	Hex	1B	2A	72	61
	Decimal	27	42	114	97

[Defined Area] ---

[Initial Value] ---

[Function] Starts the block
 Enters the command emulator mode.
 This command is ignored during command simulator mode.
 When it enters the command emulator mode, initialize the command emulator mode.
 The corresponding initialization contents are listed below.

- Raster page length setting (ESC * r P n NUL)
- Raster top margin setting (ESC * r T n NUL)
- Raster left margin setting (ESC * r T n NUL)
- Raster right margin setting (ESC * r T n NUL)
- Raster EOT mode setting (ESC FF EOT)
- Raster FF mode setting (ESC FF NUL)
- Clear raster image buffer

(*) Raster page length setting (ESC * r P n NUL), is initialized to 0.
 (*) Raster print color setting (ESC * r K n NUL) is not initialized when entering raster mode.
 (*) Raster print quality setting (ESC * Q n NUL) is not initialized when entering raster mode.

ESC * r b

[Name]	End the block				
[Code]	ASCII	ESC	*	r	b
	Hex	1B	2A	72	62
	Decimal	27	42	114	98

[Defined Area] ---

[Initial Value] ---

[Function] Ends the block
 Maintains a command emulator.
 If raster data remains in the image buffer of the raster mode, command emulator is maintained when raster EM mode is executed.

ESC * r e n NUL

[Name] Set raster EM mode
 [Code] ASCII ESC * r e n NUL
 Hex 1B 2A 72 65 n 00
 Decimal 27 42 114 101 n 0

[Defined Area] n = 0, 1, 2, 3, 8, 9, 12, 13, 32, 33, 36, 37

[Initial Value] Cutter model n = 13

TearBar model n = 3

[Function] Sets the raster EM mode.

The EM mode, is an operation to be performed by the raster document end command (ESC FF EM).
 n1 is a decimal notation using ASCII characters (up to 255 digits)

<EM mode setting format>

n	Model		Function		
	Cutter	TearBar	FormFeed	Cut Feed	Cutter
0	Valid	Valid	Set To Default	Set To Default	Set To Default
1	Valid	Valid	x	x	x
2	Valid	Valid	x	Cut Feed	x
3	Valid	Valid	x	Tear Bar Feed	x
8	Valid	Valid	x	x	Full Cut
9	Valid	Valid	x	Cut Feed	Full Cut
12	Valid	Valid	x	x	Partial Cut
13	Valid	Valid	x	Cut Feed	Partial Cut
32	Invalid	Invalid			
33	Invalid	Invalid			
36	Invalid	Invalid			
37	Invalid	Invalid			

(*) If an unsupported function is specified, it operates with supported features.

Cutter only mode: TearBar Feed -> Cut Feed

TearBar only model: Cut Feed -> TearBar Feed

Full cut only model: Partial Cut -> Full Cut

Partial Cut only model: Full Cut -> Partial Cut

ESC FF EM

[Name]	Execute EM mode			
[Code]	ASCII	ESC	FF	EM
	Hex	1B	0C	19
	Decimal	27	12	25

[Defined Area] ---

[Initial Value] ---

[Function] Executes EM mode.

It runs the operation specified in EM mode setting command (ESC * r e n NUL).

If raster data exists in the image buffer for raster mode, EM mode is implemented after printing.

If raster data does not exist in the image buffer of raster mode, this command is executed.

(TSP100IU) if the print paper length to be cut is less than 24mm, then empty feed is automatically added before cutting so that the printing paper length is 24mm.

ESC FF LF

[Name]	Execute LF mode			
[Code]	ASCII	ESC	FF	LF
	Hex	1B	0C	0A
	Decimal	27	12	10

[Defined Area] ---

[Initial Value] ---

[Function] Executes LF mode.

Nothing operates at the time when this command is processed.

Then, when a certain period of time elapses without any data being received, it starts printing.

However, if there is no non-printed data in the printer, it will not execute a line break or operate FormFeed even if this command is received.

If the printer is command emulator mode, print out unprinted data and perform a line break.

If the printer is raster mode, printing will perform a FormFeed operation by the page length setting.

3-3) USB Interface Related Command Details

The following command is a command to control the function of the USB interface.

--- Specification(1) ---

ESC # # W n , d1 d2 . . . dk LF NUL

[Name]	Register USB serial number											
[Code]	ASCII	ESC	#	#	W	n	,	d1	d2 . . .	dk	LF	NUL
	Hex	1B	23	23	57	n	2C	d1	d2 . . .	dk	LF	NUL
	Decimal	27	35	35	87	n	44	d1	d2 . . .	dk	LF	NUL

[Defined Area] n = 56 ("8")
 When registering serial number : $48 \leq d \leq 57$ ("0" $\leq d \leq$ "9"), $65 \leq d \leq 90$ ("A" $\leq d \leq$ "Z")
 When clearing serial number : d = 63 ("?") k = n

[Initial Value] ---

[Function] Executes USB serial number registration.
 After registration, the printer executes a soft reset, but at this time disconnect/reconnect of the USB-I/F is not performed, and the serial number before the value is changed is maintained.
 In order to enable the registered serial number, it is necessary to power on again.
 When initializing the serial number, insert "?" for all serial number data.

--- Specification(2) ---

ESC # # W n , d1 d2 . . . dk LF NUL

[Name]	Register USB serial number											
[Code]	ASCII	ESC	#	#	W	n	,	d1	d2 . . .	dk	LF	NUL
	Hex	1B	23	23	57	n	2C	d1	d2 . . .	dk	LF	NUL
	Decimal	27	35	35	87	n	44	d1	d2 . . .	dk	LF	NUL

[Defined Area]
 When registering serial number(8 digits) : n = 56 ("8")
 When registering serial number(16 digits) : n = 16
 When registering serial number(8, 16 digits) : $48 \leq d \leq 57$ ("0" $\leq d \leq$ "9"), $65 \leq d \leq 90$ ("A" $\leq d \leq$ "Z")
 When initializing the serial number : d = 63 ("?") k = n

[Initial Value] ---

[Function] Executes registration of 8 digits USB serial number or 16 digits one
 After registration, the printer executes a soft reset, but at this time disconnect/reconnect of the USB-I/F is not performed, and the serial number before the value is changed is maintained.
 In order to enable the registered serial number, it is necessary to power on again.

 When initializing the serial number, insert "?" for all serial number data.

3-4) Print Mode Command Details

The following command is a command to control the printing mode.

--- Specification (1) power saving mode/tone print mode not compatible models ---

ESC RS C n

[Name] Select/Cancel two-color print mode
 [Code] ASCII ESC RS C n
 Hex 1B 1E 43 n
 Decimal 27 30 67 n

[Defined Area] $0 \leq n \leq 1, 48 \leq n \leq 49$ ("0" $\leq n \leq$ "1")

[Initial Value] n = 0, 48

[Function] Selects/Cancel two-color print mode
 This setting value is initialized with a soft reset.

n	Selects/Cancel two-color print mode
0, 48	Release two-color printing mode (setting of monochromatic print mode) When in two-color printing mode, delete the two-color mode with this command. If you already have deleted two-color printing mode, this command is ignored. When the two-color printing mode is released with this command, the following process is executed <ul style="list-style-type: none"> • If there is a non-printed data, print the non-printed data in a two-color mode. • Initialize the print color (two-color printing mode set to black) • Set the print density setting in the monochromatic print mode • Set the print speed setting in the monochromatic print mode
1, 49	Select two-color print mode When in monochromatic printing mode, select two-color printing mode with this command If the two-color printing mode is already selected, the command is ignored When the two-color printing mode is selected by this command, the following process is executed <ul style="list-style-type: none"> • If there is unprinted data, and prints the unprinted data in the monochrome mode • Initialize the print color (two-color printing mode is set to black) • And set the print density setting in the two-color printing mode

--- Specification (2) power saving mode compatible model ---

ESC RS C n

[Name] Select print mode
 [Code] ASCII ESC RS C n
 Hex 1B 1E 43 n
 Decimal 27 30 67 n

[Defined Area] $0 \leq n \leq 1, 48 \leq n \leq 49$ ("0" $\leq n \leq$ "1")

[Initial Value] n = 0, 48

[Function] Selects the print mode.

DIPSW setting	n	Printing Mode
Enable energy-saving	0, 48	Invalid
	1, 49	Invalid
Disable energy-saving	0, 48	Selection of standard print mode
	1, 49	Selection of two-color printing mode

Setting details when selecting and canceling two-color print mode are as follows.

Selects/Canceling two-color print mode	Configuration details
When disengaged When the standard print mode is selected	When the two-color printing mode is released with this command, the following process is executed <ul style="list-style-type: none"> • If there is a non-printed data, print the non-printed data in a two-color mode. • Initialize the print color (two-color printing mode is set to black) • Set the print density setting in the monochromatic print mode • Set the print speed setting in the monochromatic print mode
When selected When two-color printing mode is selected	When the two-color printing mode is selected by this command, the following process is executed <ul style="list-style-type: none"> • If there is unprinted data, and prints the unprinted data in the monochrome mode • Initialize the print color (two-color printing mode is set to black) • And set the print density setting in the two-color printing mode

--- Specification (3) tone print mode compatible models compatible ---

ESC RS C n

[Name] Select print mode
 [Code] ASCII ESC RS C n
 Hex 1B 1E 43 n
 Decimal 27 30 67 n

[Defined Area] $0 \leq n \leq 1$, $48 \leq n \leq 49$ ("0" $\leq n \leq$ "1"), $8 \leq n \leq 8$

[Initial Value] n = 0, 48

[Function] Selects the print mode.

n	Select print mode
0, 48	Selection of monochromatic print mode When in two-color printing mode/gradation printing mode, select monochromatic printing mode with this command If the monochromatic printing mode is already selected, the command is ignored When the monochromatic printing mode is selected with this command, the following process is executed <ul style="list-style-type: none"> • If there is non-printed data, print the non-printed data with the current print mode (two-color printing mode/gradation print mode) • Initialize the print color (two-color printing mode is set to black) • Set the print density setting in the monochromatic print mode • Set the print speed setting in the monochromatic print mode
1, 49	Selection of two-color printing mode When in monochromatic printing mode/monochromatic print mode, select two-color printing mode with this command If the two-color printing mode is already selected, this command is ignored When the two-color printing mode is selected by this command, the following process is executed <ul style="list-style-type: none"> • If there is non-printed data, print the non-printed data with the current print mode (monochromatic print mode/gradation print mode) • Initialize the print color (two-color printing mode is set to black) • And set the print density setting in the two-color printing mode (Printing speed fixed in the two-color printing mode)
8, 56	Selection of tone print mode When in monochromatic printing mode/two-color print mode, select gradation printing mode with this command If the gradation printing mode is already selected, this command is ignored When the gradation printing mode is selected with this command, the following process is executed <ul style="list-style-type: none"> • If there is non-printed data, print the non-printed data with the current print mode (monochromatic print mode/two-color print mode) • Initialize the printing gradation (set to the tone mode gradation 1) • Set the print density setting in the monochromatic print mode (Printing speed fixed in the gradation printing mode)

ESC RS S n

[Name] Select print startup setting

[Code] ASCII ESC RS S n
 Hex 1B 1E 53 n
 Decimal 27 30 83 n

[Defined Area] $0 \leq n \leq 1$
 $48 \leq n \leq 49$

[Initial Value] Memory Switch Settings

[Function] Selects the print startup setting.

If the settings will not change when processing this command, the command is not executed.

If unprinted data exists when processing this command, the data is printed out and then the command is executed.

If printing when processing this command, the command waits for printing to stop and changes the print startup setting.

This command setting is initialized by a printer reset.

Parameter details

n	print startup setting
0, 48	Page
1, 49	Line

3-6) Reserved

3-7) Reserved

3-8) Printer Information Related Commands Details

ESC GS (S n m [d1...dm]

[Name]	Register/Clear printer information						
[Code]	ASCII	ESC	GS	(S	n	m [d1 . . dm]
	Hex	1B	1D	28	53	n	m [d1 . . dm]
	Decimal	27	29	40	83	n	m [d1 . . dm]

[Defined Area] n = 5

When registering information:

Defined region of m is as in the following table

$48 \leq d \leq 57$ ("0" $\leq d \leq$ "9"), $65 \leq d \leq 90$ ("A" $\leq d \leq$ "Z"), $97 \leq d \leq 122$ ("a" $\leq d \leq$ "z")

When clearing information:

m = 0

[Initial Value] ---

[Function] Parameter details

- n : Register information
- m : Registered number of data against information
- d : Registration data

This command is, in addition to the printer information that is set at the factory, is a command for the user to arbitrarily register and clear the printer information.

This command can be specified at the beginning of a line.

However, if there is unprinted data in the line buffer, print the data in the line buffer and execute this command.

If it is determined that there are no problems with the parameter n and m, start processing this command.

If n or m was outside the definition, abort the command analysis.

After the registration is finished or the enforced termination of registration process, execute the printer set.

During the registration process (between the first parameter which is judged OK to when the initialization of the printer is completed after registration), error processing, mechanical operation, status processing and such are not executed.

When clearing registration information, specify m = 0.

n	m	Register information	Usage example
0		Reserved	
1		Reserved	
2		Reserved	
3		Reserved	
4		Reserved	
5	$1 \leq m \leq 16$	Product serial number	2284210080600197

7		Reserved	

ESC GS) P pL pH fn

[Name] Send printer information factory settings

[Code] ASCII ESC GS) P pL pH fn
 Hex 1B 1D 29 50 pL pH fn
 Decimal 27 29 41 80 pL pH fn

[Defined Area] pL = 1, pH = 0
 fn = 49

[Function] It will send the information of the printer that is set at the factory.

[More information] Send in the following format.

ESC GS) P pL pH fn [Tag name=Parameter, Tag name=Parameter, ...] LF NUL

There is a tag name associated to the beginning of each parameter, and a parameter corresponding to each tag name is sent.

The tag name is up to the equal sign ("="), and after that is the parameter.

Each set of tags and parameters are separated with a delimiter "," and (2CH).

Printer information that is sent by this command is different depending on the model. Only the information source of the printer that is compatible (a set of tags + parameters) are transmitted.

<LF> <NUL> represents the terminal, the tag and its parameters after that are not transmitted.

Parameters are sent as a string.

If the information can not be obtained, transmits the following data.

ESC GS) P pL pH fn LF NUL

Tag	Parameter information
PrSrN	Product serial number

ESC GS) I pL pH fn

[Name] Send printer information
 [Code] ASCII ESC GS) I pL pH fn
 Hex 1B 1D 29 49 pL pH fn
 Decimal 27 29 41 73 pL pH fn

[Defined Area] pL = 1, pH = 0
 fn = 49

[Function] Send information of the printer that has been set by "Command ESC GS (S".
 However, when the printer information is not registered by ESC GS (S, or printer information is cleared, the printer information that was set at the factory is sent.

[More information] Send in the following format.
 ESC GS)I pL pH fn [Tag name=Parameter, Tag name=Parameter, ...] LF NUL

There is a tag name associated to the beginning of each parameter, and a parameter corresponding to each tag name is sent.

The tag name is up to the equal sign ("="), and after that is the parameter.

Each set of tags and parameters are separated with a delimiter "," and (2CH).

Printer information that is sent by this command is different depending on the model.

Information is transmitted from the top of the list shown below.

Only the information supported by the printer of the transmission source (a set of tags and parameters) is transmitted.

<LF> <NUL> represents the terminal, the tag and its parameters after that are not transmitted.

Parameters are sent as a string.

If the information can not be obtained, transmits the following data.

ESC GS) I pL pH fn LF NUL

--- Specification(1) ---

transmission	Tag	Parameter information	
↓	PrHwV	Printer main body HW version	
↓	PrSrN	Product serial number	up to 16 digits (Information less than 16 digits is NUL.)
↓	BtDvN	Bluetooth device name	Fixed 16 digits (Information less than 16 digits is NUL.)
↓	BtAtC	Bluetooth auto connection	Auto connection Invalid: BtAtC=00 Valid:BtAtC=01
↓	BtIpN	Bluetooth iOS port name	Fixed 16 digits (Information less than 16 digits is NUL.)
↓	BtDsC	Bluetooth Search Permitted Setting	Search Prohibited: BtDsC=00 Search Permitted: BtDsC=01

--- Specification(2) ---

transmission	Tag	Parameter information	
↓	PrHwV	Printer main body HW version	
↓	PrSrN	Product serial number	up to 16 digits (Information less than 16 digits is NUL.)
↓	UsSrN	USB serial number

↓	BtDsC	Bluetooth Search Permitted Setting	Search Prohibited: BtDsC=00 Search Permitted: BtDsC=01

3-9) Customer display Commands

Applicable Customer display

Refer to the printer's specification manuals.

ESC GS B @

[Name] Send data to a customer display
 [Code] ASCII ESC GS B @ n1 n2 d1 ... dk
 Hex. 1B 1D 42 40 n1 n2 d1 ... dk
 Decimal 27 29 66 64 n1 n2 d1 ... dk

[Defined Area] n1+n2x256 : BYTE count ($1 \leq d \leq 65535$)
 k : n1+ n2x256

[Initial Value] ---

[Function] The customer display command is sent to a customer display.

ESC RS B A

[Name] Status request
 [Code] ASCII ESC RS B A
 Hex. 1B 1E 42 41
 Decimal 27 30 66 65

[Defined Area] ---

[Initial Value] ---

[Function] Receives the printer status

The customer display status transmission format from the printer
 <ESC> <RS> B A n

Bit (n)	Status
0	No data in customer display buffer
	Data exists in customer display buffer
1	No connection of customer display
	Customer display is connected to the printer
2 – 7	Reserved

ESC GS B B

[Name] Customer display data request
 [Code] ASCII ESC GS B B
 Hex. 1B 1D 42 42
 Decimal 27 29 66 66

[Defined Area] ---

[Initial Value] ---

[Function] Acquire customer display data from a customer display.

The customer display data transmission format from the printer
 <ESC><GS> B B n1 n2 d1...dk

n1+n2x256 : BYTE count ($1 \leq d \leq 65535$)
 k : n1 + n2 x 256

ESC GS B C

[Name] Buffer clear
 [Code] ASCII ESC GS B C
 Hex. 1B 1D 42 43
 Decimal 27 29 66 67

[Defined Area] ---

[Initial Value] ---

[Function] A customer display buffer of a printer is cleared.

4. APPENDIX

4-1) Appendix-1 Standard Status

Standard status, is a status group which is returned from the printer to the query from the host. Standard status is structured with "Header 1" + "Header 2" + "multiple-byte Printer Status", and is returned continuously to the host. Host will, for every 1 byte received, according to the identification method, execute data identification. Standard status, is always replying to inquiries from the host.

Header 1

Header 1 is a 1-byte length information that is sent to the head of a standard status.

The structure of header 1 is as indicated in the following chart. Header 1, displays the sent bit number for the overall status that includes bit 1 to bit 3, and bit 5bit and header 1. Host acquires the sent byte number information and always receives the status data for the sent byte number. For reference, the relationship between the transmission bit count and header 1 is as shown in the chart below. This data, because the header 1 to indicate it is bit 0 is always 1 (the second and subsequent bytes always 0), so when detecting the header 1 just confirm that bit 0 = 1 and bit 4 = 0. In addition, bit 6 for future expansion, is ignored by host-side processing.

< Header 1 (the first byte) >

Bit		Condition		TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100
		"0"	"1"	U	PU	IIU	GT	LAN	IIIW	IIILAN	IIIBI	IIIU
7	Fixed at "0"		-	0	0	0	0	0	0	0	0	0
6	Reserved (0 fixed)		-	0	0	0	0	0	0	0	0	0
5	Print status number of bytes			1	1	1	1	1	1	1	1	1
4	Fixed at "0"		-	0	0	0	0	0	0	0	0	0
3	Print status number of bytes			0	0	0	0	0	0	0	0	0
2	Print status number of bytes			0	0	0	0	0	0	0	0	0
1	Print status number of bytes			1	1	1	1	1	1	1	1	1
0	Fixed at "1"	-		1	1	1	1	1	1	1	1	1

The actual number of bytes sent and the support table for header 1

Number of bytes sent n ($7 \leq n \leq 15$)	Header 1
7	00001111B (0F Hex)
8	00100001B (21 Hex)
9	00100011B (23 Hex)
10	00100101B (25 Hex)
11	00100111B (27 Hex)
12	00101001B (29 Hex)
13	00101011B (2B Hex)
14	00101101B (2D Hex)
15	00101111B (2F Hex)

Header 2

Header 2 is a 1-byte length information which is transmitted to the second byte of the standard status. Structure of the header 2 in the table below.

Header 2, for bit 1 to bit 3, and bit 5 is indicating the standard status version (standard status version).

The relationship of the actual version and header 2 is as shown in the chart below. Standard status version is to up new information for the bit position of the printer status that is empty until the addition of new feature in the future.

If you do not maintain the standard status version on the host side, it is okay to ignore the received header 2.

< Header 2 (the second byte) >

Bit		Condition		TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100

.	.
.	.
30	01101100B (6C Hex)
31	01101110B (CE Hex)

Printer status

The printer status is the status itself that is sent for the 3rd byte onwards for the standard status.

Printer status is (the 2 sent bytes that is attached to header 1) which is returned.

The printer status will always be updated to the newest information. (History does not exist)

The configuration of the status body is shown below.

< Printer Status 1 printer state (third byte) >

Bit		Condition		TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100	TSP100

Status identification method

COMMAND FUNCTION LIST	Status							
	bit7	bit6	bit5	bit4	bit3	bit2	bit1	bit0
Normal status (Header 1)	0	*	*	0	*	*	*	1
Normal status (except header 1)	0	*	*	0	*	*	*	0

0 = "0" represents fixed bit / 1 = "1" represents fixed bit / * = represents the changing bit

4-2) Appendix-2 Printer Status Transmission Specification for Wireless Ethernet I/F and LAN I/F

Describes the printer status transmission specification for the Ethernet I/F and wireless LAN I/F.

1) Transmission format

- If you want to send only STAR ASB
 $\boxed{\text{STAR ASB (2nd byte Bit-7=1)}} + \boxed{\text{Length}}$ (Length = 0x0000)
- If you want to send printer status transmission other than STAR ASB
 $\boxed{\text{STAR ASB (2nd byte Bit-7=1)}} + \boxed{\text{Length}} + \boxed{\text{Status Data}}$

<Length details>

- 2-byte value indicating the number of bytes of status data ($0x0000 \leq \text{Length} \leq 0x0200$)
- If Status data is 10 bytes, Length = 0x000a
- If sending only STAR ASB, add Length = 0x0000
- If length is added to STAR ASB second byte Bit-7, then is set to Bit-7 = 1

Detect whether analysis of status detects all the bytes for ASB for the first byte STAR ASB, and length is added to the bit-7 for the 2nd byte for STAR ASB. Furthermore by obtaining the number of bytes of subsequent Status Data with the length, analyzed status is possible.

2) Transmission format for $\boxed{\text{status data}}$

$\boxed{\text{Status Type}} + \boxed{\text{delimiter 1}} + \boxed{\text{Data Type}} + \boxed{\text{Status Length}} + \boxed{\text{Printer Status}} + \boxed{\text{delimiter 2}}$

(1) Status Type (2byte or 4Byte)

- < Header 1 (the second byte) >
It indicates the cause of printer status
For more information refer to 3) status transmission specification list reference
- 3rd and 4th byte
If the occurrence factors of command, indicating the n parameters of command
If the n parameter does not exist, third and fourth byte is optional
<Example> When ESC SYN 3 n command is n = 0x31, the 3rd and 4th byte is "31"

(2) Delimiter 1 (1 byte)

Transmit ":"

(3) Data Type (1byte)

Indicate the data type of the Printer Status, and send "B" (the binary type)

(4) Status Length (2byte)

2-byte value that indicates the number of bytes in the Printer Status

(5) Printer Status (variable length)

Status transmitted by the printer
Status contents are different due to the occurrence factor
For more information on status content, refer to cause of command, and automatic status

(6) Delimiter 2 (1 byte)

Transmit ":",

3) Status transmission specification list

Status causes	STAR ASB	Length	Status Data						
			Status Type		Delimiter 1	Data Type	Status Length	Printer Status	Delimiter 2
			The first and second byte occurrence factor	Third and fourth byte n parameter					
ASB Automatic status (*1)	ASB	0x0000	---	---	---	---	---	---	---
ESC ACK SOH Printer Status Request	ASB	0x0000	---	---	---	---	---	---	---
ESC GS ETX s5 Setting request for time-out	ASB	0x000F	"23"	Abridgment	“.”	“B”	0x0008	Status	“.” “,”
ESC GS) P fn49 ESC GS) I fn49 Request command response	ASB	Variable length	"A1"	Abridgment	“.”	“B”	Variable length	Block Data	“.” “,”

(*1) For automatic status it is delivered to all hosts in the TCP # 9100 port connection.

4-3) Appendix-3 Device Status Specification (USB Interface Only)

Device Status is a 1-byte status which is returned for the GET_PORT_STATUS request from the USB host.

Device status specification

Bit	Field	1	0
7 .. 6	Reserved	-	
5	Paper Empty	Paper Empty	Paper Not Empty
4	Select	Selected	Not Selected
3	Not Error	Not Error	Error
2 .. 0	Reserved	-	

4-6) Appendix-6 Supported Command List by Models
