

Proximity Based Printing and Secure Cash Management for mPOS

Star Micronics is proud to announce its ProxiPRNT technology for enabling mPOS in enterprise retail.

Once integrated with the receipt printer or cash drawer, Star's ProxiPRNT enables remote access of point of sale peripherals based on the physical proximity of the tablet or smart phone device being used by the sales staff. ProxiPRNT enables the sales clerk to automatically select and print to a nearby printer as well as ensures that a cash

drawer can only be opened wirelessly if the clerk is standing right next to it.

Based on BLE (Bluetooth low energy) technology, Star's ProxiPRNT technology works with both iOS and Android devices. Low power requirements, small size, low cost and compatibility with a large installed base of mobile phones, tablets and computers make Star's ProxiPRNT technology easy to integrate and implement for any mobile POS application.

- Automatically Selects Network Printer Based on Proximity
- Secure Cash Management
- Compatible with iOS and Android Devices
- Easy to Integrate for any mPOS Application
